Landscape Architecture Project Description

For this landscape architecture design, I was inspired by the conservation of nature and application of environmentally friendly spaces coexisting with the bustling atmosphere of the Windy city. My design is a reinvented version of the University of Illinois at Chicago Student Center East that not only incorporates its existing technologically advanced flare, but also has several green spaces where students can relax from a hard day of school or use it to study for academic classes. In addition, the roof includes environmentally friendly features like a solar powered panel above the elevator that helps power the electrical aspects of the design and a recycled tempered glass fence around the perimeter of the roof for safety precautions. There are also multiple seating areas where students can sit and still be comfortable with the shade provided by the large trees. The UIC Student Center is a place that is meant for students to explore opportunities and be productive to accomplish the difficult tasks college requires, and this landscape architecture design further encourages students to succeed in their goals.
